

ABSTRACT OF THE DISCLOSURE

An integrated network gives priority to message traffic associated with a first network over message traffic associated with a second network. This arrangement allows a private network, such as an emergency network, to be integrated with a public network, such as a cellular network, while preventing the cellular network traffic from blocking emergency network traffic. Lower priority connections can be preempted by higher priority connections. The integrated network can migrate a request from a first node to a neighboring node and can re-route a connection around a failed link.
